

UPS MOUNTING FRAMES

Many UPS/Battery cabinets are installed on 'raised floors' which dependant upon their size can impose very high levels of point loads.

In such circumstances we can supply a 'bespoke' frame which sits directly onto a solid floor or structural slab.

The height of the frame is designed to match the floor void and is provided with adjustable feet on each of the uprights to overcome any floor irregularities.

Adjustable tile supports around the edge of the top of the frame facilitate the support of installed floor tiles up to the frame edge.

Options include steel or aluminium gland plates to accommodate glanding of input/output cables and internal cable-ways.

Each frame is designed and manufactured to suit the equipment cabinet design and the individual project requirements.
