

TOP CABLE ENTRY PLINTHS

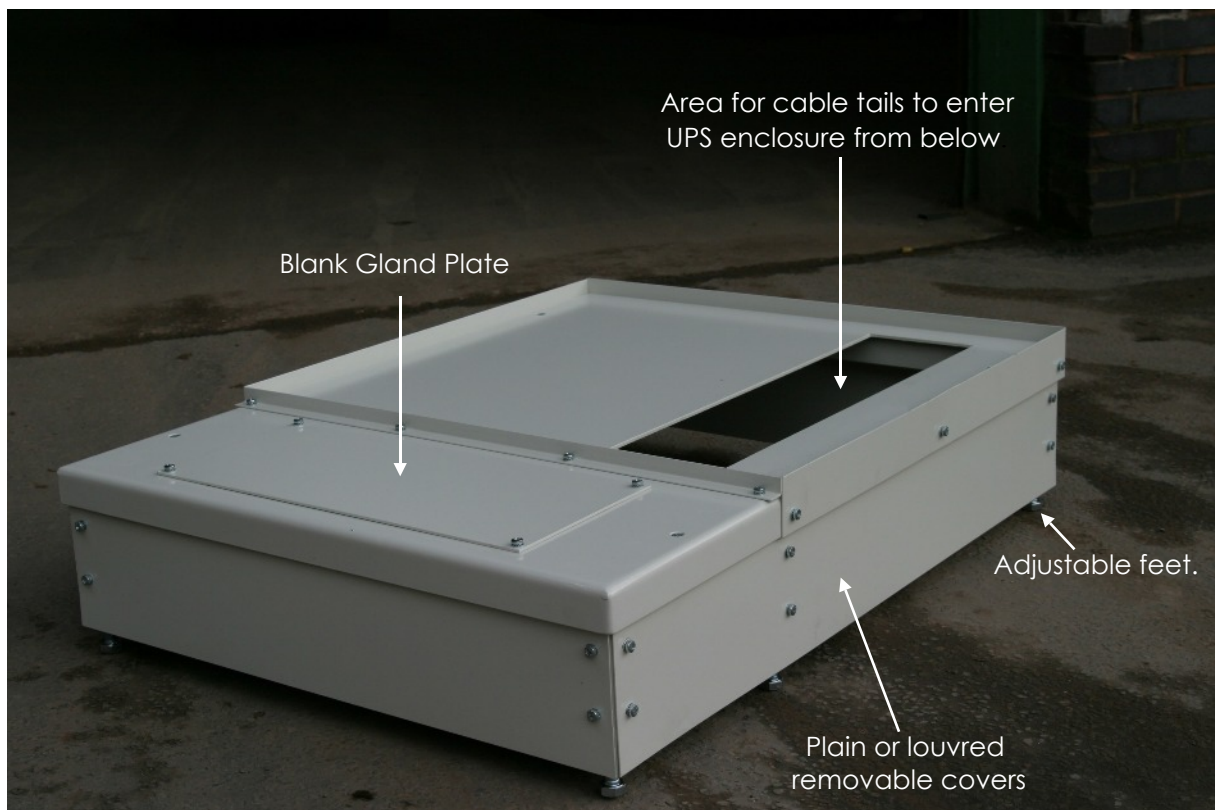

Most UPS cabinets for commercial applications today are designed for bottom cable entry and in order to facilitate cables from above require an additional cabinet to be located adjacent to the UPS enclosure.

The 'Top Cable Entry Plinth' is a cost effective and technically acceptable solution to accommodate the requirement for top cable entry.

The plinths can be designed to include:

- Glanding of either SWA or flexible type cables.
- Steel or aluminium gland plates.
- Ventilation louvre's, thus ensuring UPS ventilation requirements are maintained or even improved.
- Variation in orientation of UPS cabinets to suit specific installations.
- Adjustable feet to overcome uneven floors.
